Store Admin Dashboard

Technical Architecture & Flow Specification Report

Author: Senior Software Engineer & UI/UX Architect

Date: 7/30/2026

1. Executive Project Summary

This document details the completed modules, reactive state layout, and interaction flow diagrams for the enterprise-grade DigiShop Store Admin Dashboard. The system is built using Angular (Standalone Components) using Signals for optimized, zone-less ready state management.

Completed Core Modules

- **Global Design System**: Establishes design tokens and CSS variables, including support for animations, responsive behaviors, and micro-interactions.
- **Shell & Sidebar Layout**: Implements a responsive sidebar (driven by Angular Signals), dynamic breadcrumbs, quick global search, and user profile management.
- **Store Management Module**: Features a map toggle, search bar query parsing, category and status filtering, and paginated outputs.
- **Analytics Module**: Displays analytics dashboards featuring dynamic SVG area and donut charts, active product rankings, and real-time live activity feeds.
- **Locations Module**: Includes a map visualization displaying active stores, radius boundaries, and coordinates auditing.
- **Toast Notifications Engine**: Manages alerts and messages integrated with custom CSS slide-in/out transitions.

2. Architectural Flow & State Sync

A centralized StoreService holds the global state of all ecommerce stores using Angular signals. This ensures that any action performed on one page is instantly propagated throughout the entire application.

Architecture Interaction Diagram

1. User clicks Delete/Disable button on UI -> StoreService state signal updates.
2. UI reads StoreService.stores() signal, triggering template re-render instantly.
3. Store creation triggers saveStore() which appends to stores list and redirects to dashboard.
